JUST A THOUGHT

So, you are a third-world country that has no ability to build *missile-systems* for defense. Yet, you think you need to protect yourself from Russia, therefore, you purchase an air-defense-missile-system from the United States. After doing so, you feel relatively safe. But then there comes a day when you feel it necessary to protect yourself from the United States. But you're not worried, after all, you do have the missile-system.

What many people fail to realize is that these military-weapons-systems are all computer controlled, and it is a no-brainer for the builder of the system to put in a ***back-door-of-control*** such that, if the United States is the supplier of the missile-system, they can use their satellites and take control of the missile, directing it wherever they want it to go. And wherever it goes, it will be proved that it came from some little third-world-country, but no one will know that the little-third-world-country lost control of the missile, giving the United States *plausible deniability*.

And, of course the reverse could be true if buying a missile defense system from Russia.

In the end, it becomes very easy for the supplier of such weapons to engineer a ***false-flag-deception***, which has the potential to begin a war, perhaps a WORLD WAR. It's a thought, but perhaps one that should be considered and included in any analysis involving computer controlled weapons!
